AI-NATIVE WEB DEVELOPER

SUMMARY

Frontend developer who ships production web work by directing AI coding agents (Claude Code, Cursor, GitHub Copilot) and reviewing their output ruthlessly. Translates Figma designs into pixel-accurate React components, builds reusable component libraries with Tailwind CSS, and holds design-token and theming discipline. Backend and cloud depth to catch agent output that is confidently wrong. Benchmarked four LLM families across 700+ evaluation pairs, so model selection is an evidence decision. Strong bias to ship.

TECHNICAL SKILLS

AI Coding Agents: Claude Code, Cursor, GitHub Copilot, GPT, LLM APIs, prompt engineering, context engineering (file paths, line references, prior art), sub-agent decomposition, screenshot and browser-inspection iteration loops, agent code review, multi-model benchmarking

Frontend: React, Next.js, Astro, React Native, Expo, JavaScript, TypeScript, HTML5, CSS3, Tailwind CSS (incl. v4), semantic design tokens, OKLCH color, dark/light theming, component libraries, design systems, responsive layout, state management, Figma to code, modern build tooling (Vite), Vercel

SEO and Web Architecture: technical SEO, canonical URLs, 301 redirects, redirect mapping, structured data (JSON-LD, schema.org), sitemaps, robots.txt, internal linking, top-traffic URL protection through migrations, information architecture, Core Web Vitals, Lighthouse, semantic HTML, Search Console

Marketing Web Delivery: landing pages, marketing sites, microsites, multi-brand voice and visual identity, brand guidelines, copy editing, conversion-focused layout, competitive research

Backend and APIs: Python, Django, GraphQL (Graphene), REST APIs, PostgreSQL, Redis, Temporal, C/C++, SQL, C#/.NET

Cloud and DevOps: AWS (S3, CloudWatch, SQS, SNS), Docker, Git, GitHub, CI/CD, Linux, code review of code authored by others, automated testing, Agile delivery

EXPERIENCE

SDE (Backend) Intern | Data Axle | Pune, India

Jan 2026 - Jun 2026

- Owned a DirectMail microservice end to end (Django, GraphQL/Graphene), replacing legacy monolith paths and cutting frontend data-fetching overhead by 30% across 3 enterprise client applications; API shape driven by what consuming UIs actually needed.
- Reviewed, corrected and merged code authored by others; drove test coverage to 94% and cut production defects by approximately 25%, working in tight critique-heavy loops with senior reviewers.
- Used AI coding agents (Cursor, GitHub Copilot) as the primary execution engine for implementation while keeping architecture and review decisions human-owned; rewrote or discarded agent output when it drifted from the intended design.
- Deployed cloud-native services on AWS with monitoring and structured logging, reducing incident diagnosis time by approximately 40%; orchestrated fault-tolerant workflows with Temporal at 99%+ execution success.

Software Engineer Intern (Frontend) | ONJI Softwares Pvt Ltd

Jun 2025 - Aug 2025

- Built the frontend of a cross-platform product in React Native and Expo, owning component structure, reusable component set, navigation, authentication and state management.
- Translated Figma designs into pixel-accurate implementations, holding visual consistency and brand identity across screens; reused shared components where they fit and built custom components where the design required it.
- Improved load performance by 20% through render and state optimisation, verified through browser inspection rather than metrics alone; delivered on Agile sprint cadence with Git-based review.

PROJECTS

Multi-LLM Evaluation and RAG System | IIT BHU collaboration | GitHub

2025

- Benchmarked Gemma, Qwen, Llama and StableLM across 700+ Q&A pairs using BLEU, ROUGE-L and BERTScore, producing a hands-on basis for knowing which model to reach for and where each one quietly degrades.
- Built the retrieval layer with Sentence Transformers and FAISS plus an end-to-end evaluation pipeline.

Audio-Video Deepfake Detection | GitHub

2025

- Hybrid CNN and Vision Transformer model at 92% accuracy on FaceForensics++, shipped as a working product: preprocessing, training, Flask API and a real-time video pipeline. Output quality judged visually, frame by frame.

Systems Engineering: Distributed Rate Limiter, Mini Kafka | GitHub

2024 - 2025

- Redis and Lua distributed rate limiter (token bucket, sliding window) at 10K+ requests/sec, under 5ms latency. Event streaming platform with producer-consumer topics, partitioning, offset-tracked log storage and concurrent consumers.

EDUCATION AND ACHIEVEMENTS

Manipal Institute of Technology, Manipal | B.Tech, Cyber Physical Systems, Minor in Data Science | CGPA 7.9

2022 - 2026

ArmyPublicSchool, Pune | CBSE ClassXII, 91.83%

May 2022

- Smart India Hackathon 2024 Finalist, IIT Guwahati. NCC Sergeant, C-Certificate, Alpha Grade. Electronics Team, Dronaid.
